

**The Selden Drain Testbed:  
A New Paradigm  
Riparian Habitat, Flood Control, Water  
Supply, and Water Quality Enhancement**

**Elephant Butte Irrigation District**

J. Phillip King, P.E., Ph.D.

New Mexico State University

# EBID's Planning Scenario for Climate Change

- Long-term decrease in snowpack in Colorado and northern New Mexico, historically 80 percent of Project Water supply
  - As snowmelt runoff decreases, so does allocation to Mexico, EPCWID
- Increase in severity of extreme rainfall events
  - Management and use of storm flow does not affect allocation to Mexico, EPCWID
  - Significance of 2008 Operating Agreement, EBID, EPCWID, and BOR
- Increase in duration and severity of drought
  - Requires innovative conjunctive management of surface water and groundwater
- Strategic response is not sensitive to actual outcome.

# Storm Water Issues

- Inadequate flood control infrastructure
  - Improvisational
  - Beyond design life
  - Developed for low risk duty
  - Sediment and debris
- Aimed at evacuating water downstream
  - Could be used directly, stored, or recharged to aquifer
- Reduced habitat along river corridor
  - Canalization provides flood protection and conveyance but
- E. coli impairment from runoff events

# Selden Drain Testbed

- Funded by RER through NMED
- Major construction completed in 2009
- Ongoing monitoring and evaluation
- Included in National Science Foundation proposal aimed at reinventing urban water management

**Flood Control Gate**

# Plants established

A photograph of a dense, green field of tall grasses and weeds. The foreground is filled with various green plants, including what appears to be a large leafy plant in the lower left. The middle ground is dominated by tall, thin grasses. In the background, there is a line of trees, including some evergreens and a large, rounded deciduous tree on the left. The sky is a clear, light blue.

- **Weedy species**
  - Kochia, Russian Thistle, star nightshade, buffalo gourd, pigweed, others
- **Riparian species**
  - Cattails, nutgrass, mixed grasses, sunflower
  - Cottonwood, willow, salt cedar, wolfberry

# Ongoing bird surveys

- 21 bird species observed
  - Doves, sparrows, kingbirds, swallows, mallards, hummingbirds, and grackle
  - Riparian specialists: blue grosbeak, common yellowthroat, red-winged blackbird

# Selden Drain Flood Control Project - In Action

# EBID Plans for Regulating Reservoirs

- Burn Lake – Water 2025 grant in partnership with City of Las Cruces – E. coli issues
- Westside Flood Retention (Mesilla Dam)
- Tonuco Drain Regulating Project (Hatch Valley)
- Diez Lagos Retention Project (South Valley)
- La Mancha Retention Project (Central Mesilla Valley)

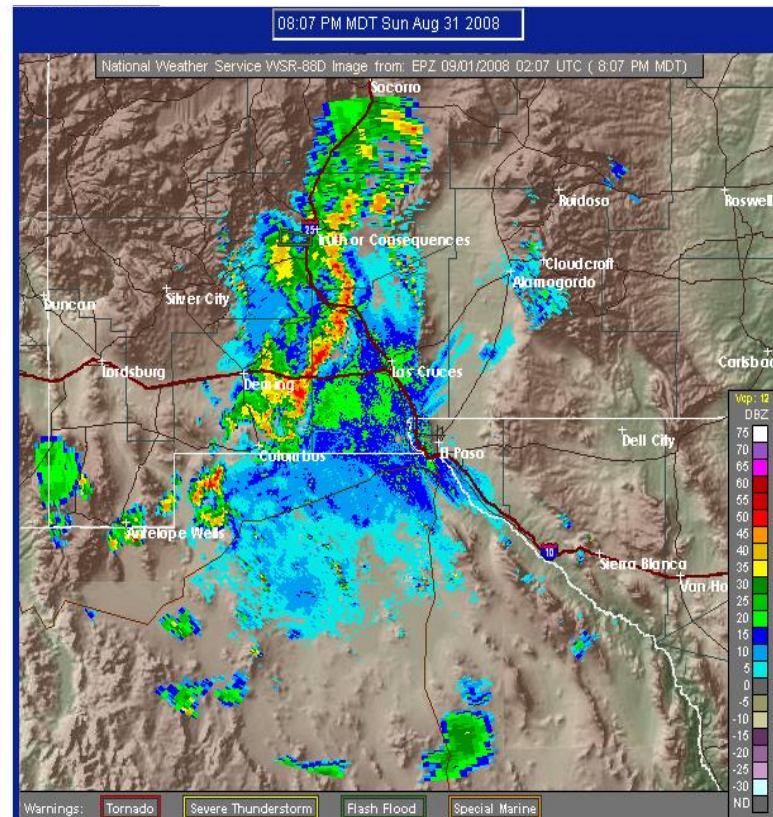

# EBID's Advance Warning System

## Real-time Monitoring

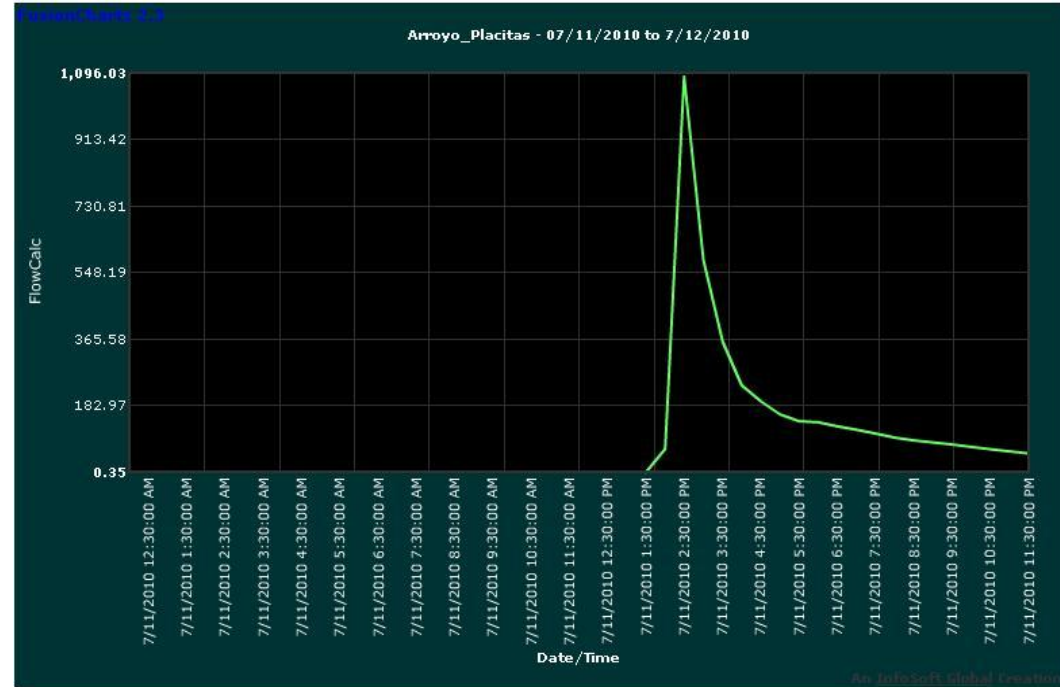

Early warning:

- Satellite and R monitoring – before a runc
- Identify prefe paths for opti instrumentat
- Monitor traje intensity of st for flood resp
- Develop imag algorithms fo forecasting (N
- Retain or rele based on incc

# EBID's Watershed Instrumentation Arroyo Metering

- Early Warning from rain gauges in upper watersheds
  - Flood warning
- Flumes for metering flow into Rio Grande
  - Flood warning
  - Diversion management
- Calibrate hydrologic models of watersheds
  - Improve forecasting
  - Improve statistical characterization of flood flows
  - Identify and prioritize areas for stormwater capture

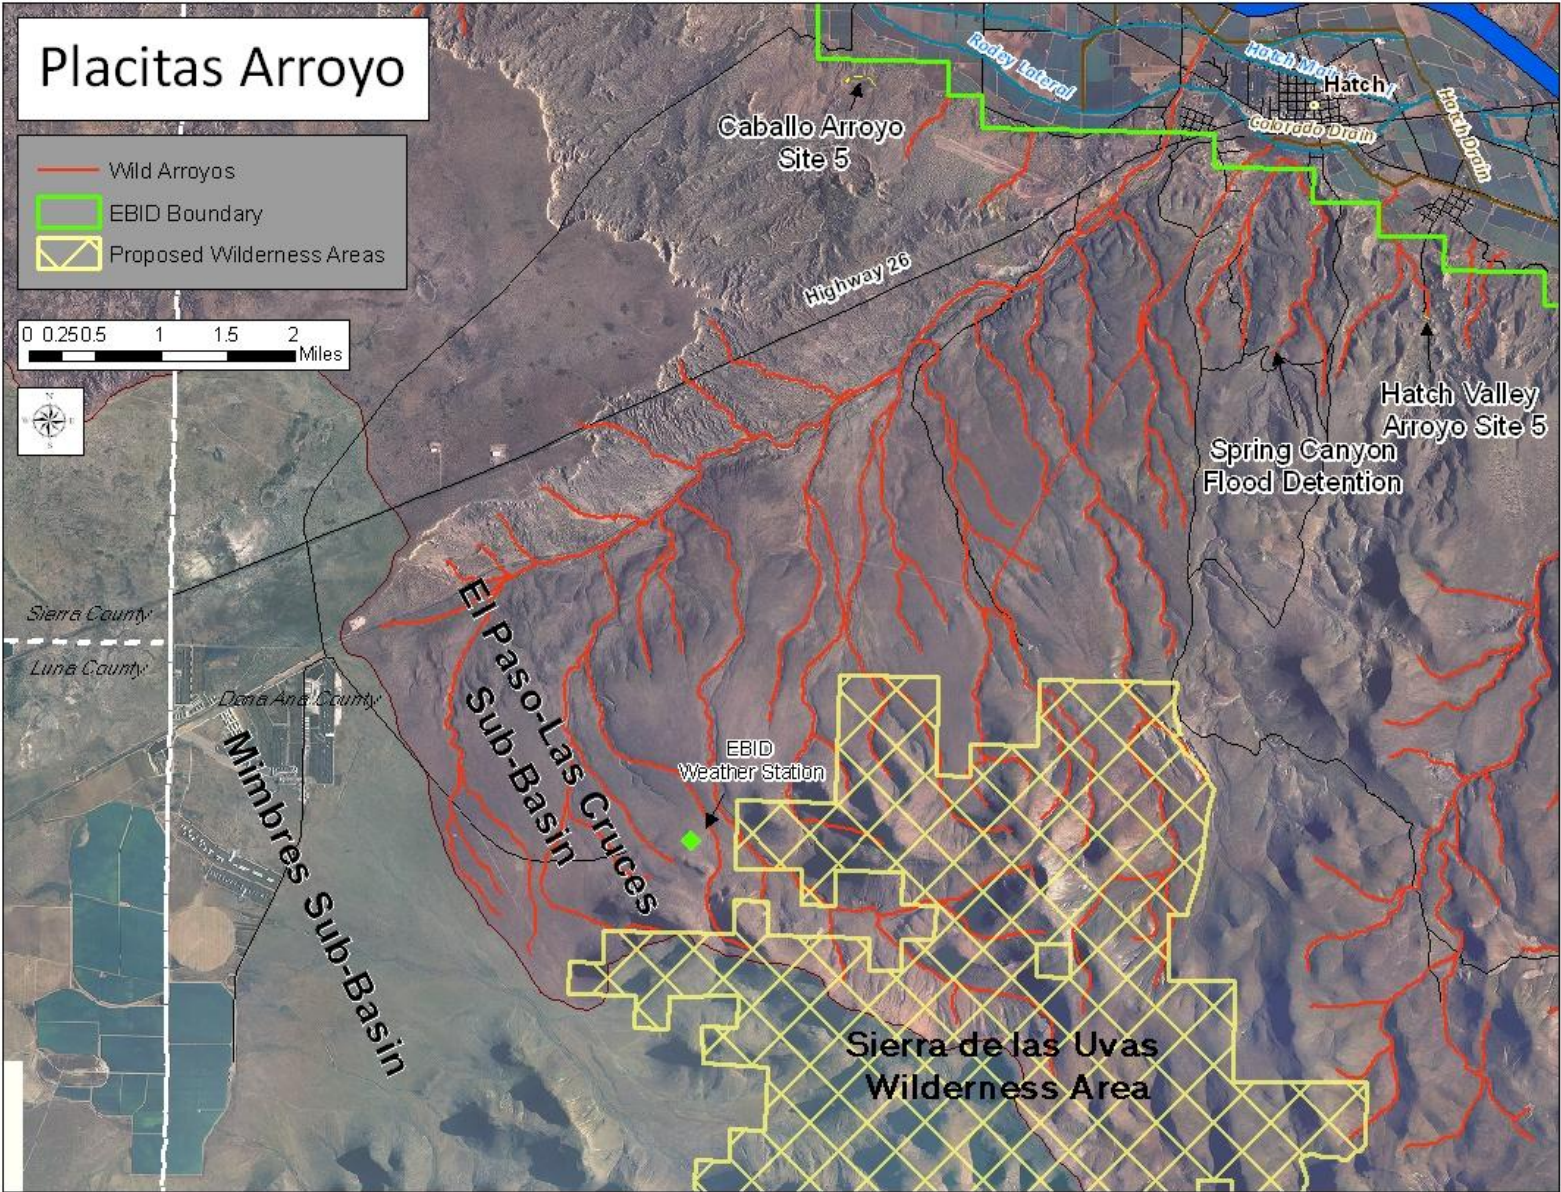

# EBID's Rapid Response to close Caballo Dam gates during Storm Flows

- 7 operational stations from Caballo Dam to the Texas State Line
- 20 minute real-time data, radio telemetry
- Operations management
- Flood tracking and warning
- Available on web, used by many local agencies

# EBID utilizes GIS data to understand the potential impact of rainfall on wild arroyos in the Placitas Arroyo Watershed

# EBID's Reservoir Instrumentation

An aerial photograph of a large reservoir, likely a dam, surrounded by green, hilly terrain. The reservoir is filled with water, and a dam structure is visible in the middle ground. The background shows a range of mountains under a clear sky.

- Early warning:
  - Dam instrumentation – storage and discharge status of flood control storage
- Track outlet flow and potential for emergency spillway flow
- Track remaining retention space
- Much safer and more timely than visual confirmation

# Regional Watershed Planning & GIS Data Integration

- EBID is working with local authorities – counties, cities, towns, villages – to form a regional stormwater & flood control entity
- EBID collected GIS data from multiple agencies relating to watershed and stormwater
- Provide data sharing via a central clearinghouse
- Advantage: The same important information is shared and used for planning and management decisions & solutions by all agencies
